

iButtons

iButtons are chips enclosed in a stainless steel case, manufactured exclusively by <u>Dallas Semiconductors</u>. Each chip has a unique serial number, which means that no two **iButtons** are alike. Besides that, they require no power, no cables or any other sort of installation.

iButtons have proved to be the best solution for directing the patrol officer in his tours and controlling the rounds, given that **iButtons** are resistant, durable, and cannot be reproduced.

The user shall use the **iButtons** in programming **Guard-i** to identify and control the checkpoints of the rounds to be performed, and also other relevant checkpoints such as supervisors, employees and so on.

Numeric Button Keypad

This **Numeric Button Keypad**, or event wallet, allows the user to add more detailed information to **PROGuard-i**'s reports. The leather wallet contains 12 numeric buttons from 0 to 9, CLEAR and ENTER.

All events are represented by a number or combination of numbers. Events can be listed by using **PROGuard-i** software. Several events can be listed seeing that each event is stored in **Guard-i**'s memory.

The patrol officer can register eventual incidents by using the **Numeric Button Keypad**. This additional information will then be read in the reports. However, these incidents must first be entered when programming the wand by using **PROGuard-i** software.

Each event is listed as a number or sequence of numbers, which enables the user to register a series of different events, such as vehicle control, meter readings, weight and volume control, and even vehicle license plates; all of which are entered as numbers.
